Supervisor meeting pack: what each output is

Oct 13, 2026 · @Minidu

This explains, in plain words, every output of my work on the UISE 2027 paper so far, for the supervisor meeting on Oct 16, 2026. Each item says what it is, why it matters, and what to say about it. Some files still say "15 Oct" in their titles; the meeting has moved to Friday 16 Oct.

1. For the meeting: show these five, in this order

These five tell the whole story in about 20 minutes: what changed, the framework, the evidence it covers, and the three decisions we need.

#	File	What it is, simply	What to say to Madam
1	`Research_Approach_v3.2_Changes.pdf` (3 pages)	A one-table summary of the eight things that changed in our research plan since 7 Oct, each with before, after and why	"After checking the related papers properly, two of our earlier novelty claims were already done by others, so we now lead with what is still ours."

#	File	What it is, simply	What to say to Madam
2	`Framework_v2.pdf` (6 pages)	The design of our system: how accessibility rules become explanations, and how every explanation is checked before anyone sees it. Includes the main figure	"The prediction never changes. Profiles change how it is explained, and a check makes sure five facts always survive: flood, here, Thursday, 'possible', go-bag."
3	`XAI_Framework_v2_Guideline_Coverage.xlsx` (Summary sheet)	A check of all 50 explanation-related guidelines against the framework: which ones it handles, partly handles, leaves to the screens, or misses	"13 are covered, 20 partly, 9 are screen rules not built yet, 8 not covered. The gaps sheet says what we fix and what we report as limitations."
4	`Supervisor_Questions_15Oct.pdf` (6 pages)	The three decisions we need from you, each explained with flood examples, options and a recommendation	Ask Q1 (which contribution leads), Q2 (what the alert screen shows), Q3 (how to test the AI wording)

#	File	What it is, simply	What to say to Madam
5	`Research_Approach_v3.2_12Oct.pdf` (27 pages)	The full research plan, updated. Only bring it out if Madam wants detail; the changes summary points to the pages	"Task 5, pages 20–22, is the new framework."

2. Supporting evidence

These back up the claims in section 1; show them only if Madam asks "how do you know?".

File	What it is, simply	Why it matters
`xai-guideline-evidence-catalogue.pdf` (18 pages, 5 Oct)	The 50 of our 128 design guidelines that affect how a flood prediction is explained, each with the published evidence for it (38 with direct evidence, 9 indirect, 3 none found)	It is where our requirements come from; the coverage check is measured against it
`related-work-notes.md`	Checked facts about the three closest papers (NeuroAdaptX, Tielman 2024, Madugalla et al.), with page numbers, plus three draft related-work paragraphs	Every quote and number was checked on the page by me on 11 Oct, so the paper's related-work section is safe

File	What it is, simply	Why it matters
`Inclusive_XAI_and_RE_Research_Papers.xlsx`	A Gemini-made table comparing the three papers on the same 12 points	First draft of the comparison; superseded by the notes above
`madugalla-version-analysis.docx`	Gemini's summary of the Madugalla paper, with its numbers (62 guidelines, 67 requirements, 6 interviews, 8 evaluators)	Shows Madugalla left out cognitive impairments, our main gap
`Comparative_Verification_and_Synthesis….pdf`	Gemini's check of the claims we made about each paper	Found two claims we had to correct; less reliable than the data table
`Research_Approach_v3.1_7Oct.pdf`	The previous version of the plan	For comparing old and new, if needed
How to check the 50 guidelines (PDF)	The method and first pass behind the coverage workbook	Shows how each guideline was judged

The three Gemini files are AI-generated drafts. Everything taken from them was checked against the papers before use.

3. Code: the data model

The data model is the agreed list of what information the app holds and what each piece is called, written as code so the whole team uses the same names. It is on GitHub (`ews-mobile/model/` , commit 7e65fa9).

File	What it holds, simply	Example from our scenario
`forecast.ts`	What the ML model predicted. Nothing is allowed to change it	Flood, Hanwella, Thursday, 0.29 chance, "Possible", get your go-bag ready
`profile.ts`	How this person likes things explained, plus the three ready-made profiles	Words only or words + picture; main message first; read aloud
`explanation.ts`	What the screen actually says, with one slot for each of the five facts, and the shape of the check	"Flooding is possible here on Thursday. 3 in 10 chance."
`__fixtures__/hanwella.ts`	A worked example: yesterday's and today's forecast, and one explained version	Yesterday 1 in 10, today 3 in 10
`model/README.md`, `data/synthetic/README.md`	Short guides to the files and to the made-up (synthetic) forecast data	All values are synthetic and labelled so
`build-plan.md`	The plan for building the prototype screens	Which screens come first and what each needs
invariants.ts + __tests__/invariants.check.ts	The check: compares each explanation with the forecast before it is shown, and rejects AI wording with double negatives or idioms. Ten test cases, all pass	"There may be flooding here on Thursday" fails, because the word "possible" was dropped

File	What it holds, simply	Example from our scenario
contexts/ExplanationProfileContext.tsx	Saves the person's profile on the phone and loads it next time; refuses a profile set by a helper without consent	Choosing "Show me why" once keeps it for every forecast

What to say: "The types, the check itself and the profile store are built and on GitHub (PR #14). The check, `checkInvariants()`, passes the correct explanation and catches all nine broken versions, including a fair-sounding AI sentence that dropped the word 'possible'."

4. Team and planning documents

These show how the work is organised; Madam does not need to read them, but they answer "who is doing what, by when?".

File	What it is, simply
Work log and progress (PDF)	My tracker: every task with its status and due date, the blockers, a log of everything finished, and a timeline to submission on 13 Nov
Updates for Supun (PDF)	What I asked Supun to change in his ML work and forecast data
Second-rating guide for Imansha (PDF)	Instructions for Imansha to rate the 24-cell XAI comparison table on his own, so the result does not rest on one person's opinion
Gemini Notebook setup (PDF)	How I set up Gemini to extract facts from the three papers, with the prompts used
Start Plan (PDF or link)	The first week's plan for the team (7 Oct)

5. Not in the pack yet, and why

If Madam asks for any of these, this is the honest answer.

Output	Why it is not here	When
Imansha's second rating and the agreement count with Supun	Not received yet	Ask Imansha before Friday
Supun's XAI results, 24-cell table, `forecasts.json`, prediction screens	Supun's work; not shared with me yet	Ask Supun to bring them
Wireframes	Imansha's task	Due 22 Oct
Competitive Analysis 03 and 04	Earlier documents, not in this pack	Bring separately if needed
User study results	There is no user study; the evaluation is an expert walkthrough from 30 Oct	Never claimed

6. How the zip will be organised

One zip, four folders, numbered so the meeting files come first.

```
UISE2027_Supervisor_Pack_16Oct.zip
  00_READ_ME_FIRST.pdf            (this document)
  1_For_the_meeting/              (section 1, five files)
  2_Supporting_evidence/          (section 2)
  3_Code_data_model/              (section 3, with the folder structure from
the repo)
  4_Team_and_planning/            (section 4)
```

The zip will be made when you say so.
